3. FEATURES

- **Robin Exhaust Fan Cooling System** for low body temperatures, low noise, longer engine life and reliable performance.
- **Large 78cc 4-Stroke Engine** provides enough power for constant 500W (at 60 Hz) rated output.
- **Simple One-Touch Engine Control Switch** with the engine and fuel on/off levers and choke all integrated into one switch.
- **Easy and Reliable Starting** with pointless ignition. This generator is also a brush-less type generator for maintenance-free operation.
- **Simple Design** for a clean appearance and easy maintenance.
- **Compact and Lightweight** with an easy one-hand carrying handle grip. This generator also offers a high power-to-weight ratio and economical operation.
- **Circuit Breaker Protection** for safe operation. Replacement of fuses is not necessary in case of an overload.
- **Unique Dual Output Design** so that two separate A.C. and D.C. electrical appliances can be used at the same time.
4. SERIAL and SPECIFICATION NUMBER LOCATION

The serial number is stamped on the crankcase at the opposite side of the carburetor.
The specification and specification number are shown on the nameplate located on the rear cover.
Always specify these numbers when inquiring about the generator or ordering parts in order to get correct parts and accurate service.
5. SAFETY PRECAUTIONS

5-1 FIRE PREVENTION
1) Keep the generator away from combustible materials during operation. Take special precautions with flammable substances.
2) Do not run the generator in an incline position or while it is slanted at an angle. Avoid moving the generator while it is in operation to prevent the generator from falling over or leaking fuel.
3) Do not place a carton or similar object over the generator while the generator is running. If covered, cooling will be diminished and cause the generator to overheat.
4) Operate the generator at least 1m away from a building or wall
5) Be sure to stop the engine before filling fuel into the fuel tank.
   If fuel is filled while the engine is running, fuel vapors may rise from the fuel tank resulting in a potential fire hazard.
6) Fuel used in engine operation is very volatile and highly flammable. Take special precautions not to spill fuel when filling the fuel tank. If fuel is spilt, wipe it off thoroughly and let dry before starting the engine.
7) Do not overfill the fuel tank and always be sure to fill fuel only up to the level specified at the fuel supply port.
8) Do not smoke or use open flame when filling the fuel tank.

5-2 PRECAUTIONS for EXHAUST GASES
1) Avoid operating the generator in poorly ventilated locations such as an office, warehouse, narrow tunnel, well, hold, tank, etc.. If the generator is run continuously in such poorly ventilated areas, the operator may suffer carbon monoxide poisoning.
2) Always operate the generator with the exhaust port directed toward the open air or where good ventilation is assured.

5-3 OTHER PRECAUTIONS
1) To prevent electric shock, do not touch the generator with wet hands. For example, when the generator is used to drive a submersible pump, be sure to connect the earth cord of the generator to the earth cable of the pump.
2) Do not splash water over the generator during operation. And also avoid operating the generator in the rain. If the generator gets wet, it may fail to start or short-circuit, and the operator may possibly receive a severe electric shock.
3) Do not connect the generator to existing power lines which have been originally installed as the power supply system of a building. If connected, the generator will burn out.
4) Avoid running the generator with its cover removed.
6. COMPONENT IDENTIFICATION

7. FUNCTION of EACH COMPONENT

7-1 GENERATOR

7-1-1 STATOR
The stator consists of a laminated silicon steel sheet core, a main coil and condenser coil which are wound in the core slots.
AC and DC output are taken out from the main coil. (DC output is taken out from the part of main coil which is in the middle of the main coil.)
The condenser coil excites the stator field coil which generates AC output in the main coil.

7-1-2 CONDENSER
The condenser is mounted on the rear housing and is connected to the condenser coil which is wound in the stator. The condenser coil magnetizes the rotor which increases the density of magnetic flux.

7-1-3 RECTIFIER
The rectifier is also mounted on the rear housing and it converts AC current output from the main coil to DC current. The DC output from the diode of this rectifier is connected to the DC terminal.

7-1-4 ROTOR
The rotor consists of a laminated silicon steel sheet core and field coil which is wound over the core.
DC current in the field coil magnetizes the steel sheet core. Two permanent magnets are provided at 90 degrees from the poles for the primary exciting action.
A securely mounted fan is pressure-fitted on the end of the rotor shaft to cool the individual coils, iron cores, rectifier, and other integral parts.
Cooling air from the fan is drawn in from the ventilation vents in the rear housing, and is discharged from the exhaust port in the front housing.

7-1-5 CONTROL PANEL
The panel on the front of the housing has a receptacle with a ground terminal and AC output is taken out with a male plug.
The frequency meter is provided to see if the frequency of generated power shows 50 Hz (or 60 Hz). DC output is taken out from the red (positive, +) and black (negative, -) terminals.
7-2 ENGINE

7-2-1 CYLINDER and CRANKCASE
The cylinder and the crankcase of the engine are of an one-piece aluminum die-cast design. The cast iron cylinder liner is cast-fitted inside the cylinder. Both the intake and exhaust ports are positioned at the lateral side of the cylinder and these ports are formed by using a mold with die-cast cores. The crankcase has its joint face located on the generator side.

7-2-2 MAIN BEARING COVER
The main bearing cover is aluminum die-cast and is mounted on the generator side. By removing the main bearing cover, the interior of the engine can be inspected.

7-2-3 CRANKSHAFT
The crankshaft is constructed of forged carbon steel. The crankpin is induction-hardened and has a pressure-fitted crank gear located on the generator side of the engine.

7-2-4 CONNECTING ROD and PISTON
The connecting rod is constructed of forged aluminum alloy with both the major and minor ends utilized as bearings. The oil scraper and cap for the major end are cast together. The aluminum alloy casting piston has two compression rings and one oil ring.

7-2-5 CAMSHAFT
The camshaft is constructed of special cast iron and has intake and exhaust valve drive cams, each of which engages with the cam gear. An exclusive aluminum alloy is used on each end of the camshaft in the place of bearings.

7-2-6 VALVE ARRANGEMENT
The intake valve is installed at the oil port side and the exhaust valve at the generator side.

7-2-7 CYLINDER HEAD
The cylinder head is die-cast aluminum and has Ricardo type combustion chamber featuring greater volume capacity for improved combustion efficiency. For easier spark plug maintenance, the cylinder head is positioned at an angle to allow greater access.

7-2-8 GOVERNOR
The centrifugal weight type governor ensures constant engine speed, regardless of load fluctuations (the governor is mechanically linked to the governor drive gear).
7-2-9 EXHAUST FAN COOLING SYSTEM
Instead of blowing outside air on the engine, the Exhaust Fan Cooling System of this generator intakes the cool air and forces the hot air outside from one outlet. This keeps the body temperature lower for greater safety and extends service life.

7-2-10 LUBRICATION SYSTEM
The moving and sliding parts inside the engine are lubricated with the oil scraper fitted on the connecting rod. As the crankshaft rotates, the connecting rod moves up and down and the oil scraper moves in conjunction with the connecting rod movements to scrape up oil in the crankcase and splash it over the surfaces of the moving and sliding parts.

7-2-11 IGNITION
A flywheel/magneto ignition system is employed with the ignition timing set at 23° before top dead center. The magneto is composed of the flywheel and ignition coil with the flywheel mounted on the rotor shaft. The ignition coil is fitted to the front housing.

7-2-12 CARBURETOR
The horizontal suction type carburetor is adjusted so that the engine will provide excellent starting, good acceleration, low fuel consumption, and superior output [for details concerning carburetor construction, see the paragraph dealing with carburetor construction and disassembly/assembly (Page 49)].

7-2-13 AIR CLEANER
The air cleaner is a semi-wet type and contains a sponge element.
8. DESCRIPTION OF MAIN COMPONENTS OPERATION

8-1 ELECTRONIC IGNITION SYSTEM (Solid State Ignition System)

The electronic ignition system features a power transistor as the current control element. Therefore, the ignition system is an electronic contact point-free type that operates with the power transistor impulses controlling the current. This system also called TIC (transistor igniter circuit) is virtually free of ignition failure which generally results from contamination of the contact points, a typical problem with contact type ignition systems.

Because this ignition system has no contact points, it is not affected by moisture, oil, dust, or other contaminants. As a result, this electronic ignition system ensures sure and positive ignition with reduced maintenance.

The TIC mechanism consists of a transistor-incorporated ignition coil and a permanent magneto built-in flywheel which is pressure-fitted on the rotor shaft of the generator.

---

1) When the permanent magneto built-in flywheel starts rotating, power is generated in the primary coil of the ignition coil and current flows to the resistor $\text{①}$. From the resistor, current flows to the power transistor. With this current, the power transistor turns on, releasing current $\text{②}$. This stage corresponds to the closing of contact points.

2) As the flywheel comes to the point of ignition, the ignition timing detecting circuit is activated while the current $\text{③}$ is flowing through the circuit. When the ignition timing detecting circuit is activated, the signal transmitter transistor actuates with current $\text{④}$ flowing. When current $\text{④}$ starts flowing, current $\text{⑤}$ flowing through the power transistor is cut quickly. As a result, high voltage is produced in the secondary coil and this voltage is applied simultaneously to the spark plug which ignites for ignition. This stage corresponds to the opening of contact points.
8-2 GENERATOR OPERATION

8-2-1 GENERATION of NO-LOAD VOLTAGE

1) When the generator starts turning the permanent magneto built in to the flywheel generates 1 to 2V of AC voltage in the main coil and also generates 2 to 4 of AC voltage in the condenser coil.

2) The capacitor coil is connected to a capacitor so when a voltage is applied to the condenser coil, minimum current flows in the condenser coil. At this time, minimum flux is produced, with which the magnetic force of the rotor's magnetic pole is intensified. When this magnetic force is intensified, the respective voltages in the main coil and condenser coil rise. Current flowing in the condenser coil increases, with the magnetic flux density of the rotor's magnetic pole increasing further. Also, the main coil voltage and condenser coil voltage increases. These voltages continue rising as this process is repeated.

3) As current flows in the condenser coil, the magnetic flux density changes. DC voltage is induced in the field coil when the magnetic flux density varies. Successively, DC current is rectified by the rectifiers connected to both ends of the field coil, and DC current flows in the field circuit. With this current, the rotor core is magnetized, allowing the generator to output steady voltage.

4) When generator speed reaches 2000 to 2300 rpm (50 Hz specification) or 3000 to 3300 rpm (60 Hz specification), the current in the condenser coil and field coil increases suddenly. This acts to stabilize the respective coil output voltages.

If generator speed further rises to the rated value, the generator output voltage will reach the rated value.

8-2-2 VOLTAGE FLUCTUATIONS UNDER LOAD

When load current flows from the electric equipment to the generator, the magnetic flux which is produced as current flows in the main coil, this serves to increase current flowing in the capacitor coil. With current increased, the magnetic flux density across the rotor core rises. As a result, the current flowing in the field coil increases, and the generator output voltage is prevented from decreasing.
8.2.3 DC OUTPUT

DC output is taken out from the main coil and is fed to the diode at which time the output undergoes full-wave rectification prior to being supplied to the load connected to the generator. The diode rectifier works to allow the current to flow in direction but does not allow the current to flow in direction as shown in Fig. 8-3.

Fig. 8-4 shows the DC output circuit of the generator. DC voltage is generated in the main coil; when the voltage in A is higher than that in C, current flows in the direction shown in the figure while no current flows between C and B because current is cut off by the diode D2. Contrary to the aforementioned, if the voltage in C is higher than that in A, current flows in the direction as shown in the figure, with no current flowing between A and B. This is because the diode D1 cuts off the current between A and B. As a result, voltage generated between the DC terminals has a waveform with two peaks in one cycle, as in the case of the output waveform shown in Fig. 8-5.
9. OPERATIONAL LIMITS OF THE GENERATOR

9-1 AC OUTPUT:
Electric appliances normally have rating labels, showing the rated voltage, frequency, power consumption (input power), and other listings.

The input power specified on such labels is what is required to drive the appliance.

When an appliance is to be connected to the generator, the power factor, starting current, and other factors of the appliance must be taken into account.

9-1-1 NET RESISTANCE LOAD:
Incandescent lamps, electric heaters, etc., can be run off the generator if its capacity matches the total of the respective appliances. Each of these appliances normally have a power factor of 1.0.

Example: This generator can provide enough power to operate five 100W incandescent lamps.

9-1-2 ELECTRIC APPLIANCES WITH A POWER FACTOR LESS THAN 1.0:
Fluorescent lamps and mercury lamps normally have a low power factor. Therefore, the generator is required to generate approximately 1.2 to 2 times the power consumed by each load appliance.

Example: With this generator, three to five 80W mercury lamps can be operated.

9-1-3 MOTOR LOAD:
Generally, motors require a large starting current every time they are started. Therefore, when the generator is used to run a motor, the greatest motor starting load is applied.

The rates of power supply which the generator is required to produce for motor loads, are categorized into two sections, depending on the types of motor and load conditions at time of starting.

1) Motors (mainly rectifier motors) used for electric drills and similar devices:

Normally, the motors used for electric drills and similar appliances require the generator to produce approximately 1.2 to 3 times the power consumed at time of starting.

Example: To drive a 200W electric drill, a generator with capacity of about 300 to 600W is necessary.

2) Motors (mainly induction motors) used for pumps and compressors:

Pump and compressor drive motors require the generator to produce 3 to 5 times the power consumed when they are running, at time of starting. This is because these motors have loads when they start.

Example: To drive a 200W submersible pump, a generator with a capacity of approximately 600 to 1000W is necessary.
9-1-4 IN THE SITUATION THAT POWER CONSUMPTION IS NOT SHOWN ON THE RATING PANEL:
Occasionally, the rating panel of an electric appliance does not carry its power consumption but only shows the mechanical equivalent to the power consumption. In such a situation, it is necessary to calculate the power consumption of the device involved. Depending on the types of load, the calculated power consumption is adjusted according to paragraphs 9-1-1 through 9-1-3 above.

\[
\text{(Power consumption)} = \frac{\text{(Mechanical equivalent of device)}}{\text{(Efficiency)}}
\]

**Efficiency**
- Motors: 0.6 ~ 0.8
- Fluorescent lamps: 0.7 ~ 0.8

**Example:** A 40W fluorescent lamp with a lighting output of 40W and assuming that the power consumption of this lamp is 0.7, the power consumption is calculated as follows:

\[
40 \div 0.7 = 57W
\]

Further, as per paragraph 9-1-2, the said power consumption is multiplied by a factor of 1.2 to 2, producing a power consumption of 70 to 115W. Therefore, with this generator, four to seven 40W fluorescent lamps can be used.

**Example:** In the case of a 200W motor, the mechanical equivalent of the motor is 200W. Assuming that the efficiency of the motor is 0.7, the power consumption is calculated as \(200 \div 0.7 = 285W\). Similar to the above, the calculated power consumption is then multiplied as per paragraphs 3-1 or 3-2, taking into account the types of motor and starting conditions. The table below shows the range of loads applicable to this generator.

<table>
<thead>
<tr>
<th>Electric devices</th>
<th>Range of workable loads</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>50 Hz</td>
</tr>
<tr>
<td>Incandescent lamp, electric heater, etc.</td>
<td>Up to 400W</td>
</tr>
<tr>
<td>Fluorescent lamp, mercury lamp, etc.</td>
<td>Up to approx. 300W</td>
</tr>
<tr>
<td>Motor-driven tools etc.</td>
<td>Up to approx. 300W</td>
</tr>
<tr>
<td>Pump and compressor drive motors</td>
<td>Up to approx. 150W</td>
</tr>
</tbody>
</table>

**Table 9-1**

**NOTE 1:** With motor-driven tools and the motor-driven pumps and compressors specified in paragraphs 9-1-3 and 9-1-4, the generators of the said capacities are required only when starting the motors of the respective appliance. Once the motor has started, the power which the generator is required to supply to the motor decreases thereafter to a level approximately 1.2 to 2 times the rated power consumption. Therefore, the surplus capacity of the generator may be used for other electric appliances.

**NOTE 2:** As for the motor-driven devices specified in paragraph 9-1-3 and 9-1-4, the power requirement for starting varies according to the types of motor and the load conditions at time of starting.
9-2 DC OUTPUT

When the generator is employed to recharge batteries, care must be exercised about the specific gravity of electrolyte in each battery case.

9-2-1 MEASURING THE SPECIFIC GRAVITY OF ELECTROLYTE:

The specific gravity changes with temperature; therefore, it is converted to another corresponding to 20°C.

\[ S_{20} = S_t + 0.0007 (t - 20) \]

where

- \( S_{20} \) = Specific gravity corresponding to 20°C
- \( S_t \) = Measured value
- \( t \) = Temperature at time of measurement

9-2-2 REMAINING CAPACITY ESTIMATED WITH REFERENCE TO THE SPECIFIC GRAVITY OF ELECTROLYTE:

<table>
<thead>
<tr>
<th>Specific gravity (20°C)</th>

<td></td>
</tr>
</tbody>
</table>

Table 9-2

9-2-3 BATTERY CAPACITY:

The battery capacity is expressed in units of ampere-hour (AH). One AH stands for the capacity capable of providing one ampere of current for one hour.
9.3 SIMULTANEOUS USE THE AC/DC OUTPUT

If you use the AC/DC output simultaneously in this generator, be careful not to exceed the total power consumption.

50 Hz ———— below 200W
60 Hz ———— below 300W

NOTE: Max. output of DC is 100W (12V x 8.3A).

9.4 WIRE LENGTH

When long wires are used between the generator and a load, the resistance of each wire increases and a voltage drop occurs. Consequently, the input voltage to the load declines and occasionally damages the load.

Exercise caution when deciding on wire length. For reference, the table below shows the voltage decreases that occur in 100 m (300 ft) long wires with different cross sectional areas and varied resistances.

<table>
<thead>
<tr>
<th>Cross sectional area (mm²)</th>

Table 9.3
10. MEASURING PROCEDURES

10-1 METERS

10-1-1 VOLTMETERS

Both AC and DC voltmeters are necessary. The approximate AC voltage ranges of the voltmeters to be used for various types of generators are as follows:

- 0 to 150V: Type with an output voltage of 110 or 120V
- 0 to 300V: Type with an output voltage of 220, 230 or 240V

Fig. 10-1

10-1-2 AMMETER

Both AC and DC ammeters are necessary. The AC ammeter must have a scale range from 0 to approximately 10A. The DC ammeter must have a scale range from 0 to approximately 15A.

Fig. 10-2

10-1-3 FREQUENCY METER

The frequency meter must have a scale range from 45 to approximately 65 Hz.

NOTE: Note the range of input voltage of the frequency meter.

Fig. 10-3
10-1-4 CIRCUIT TESTER
A circuit tester is used for measuring resistances and others.

Fig. 10-4

10-1-5 MEGGER TESTER
To measure the insulation resistance of the generator. Use voltage capacity of 500V.

Fig. 10-5

10-1-6 TACHOMETER
Use the contact-less type tachometer.

Fig. 10-6
10-2 MEASURING AC OUTPUT

With the circuit shown in Fig. 10-7, measurement is made of the AC output of the generator. An electric heater or an incandescent lamp with a power factor of 1.0 is suitable as a load for the generator.

When the measured AC output of the generator is confirmed to be within the voltage range specified in the table below, over its voltage rating, the AC output is normal.

Measurement must be made under rated load and at rated speed; sometimes, load and speed adjustments are necessary.

<table>
<thead>
<tr>
<th>Voltage rating</th>
<th>110V</th>
<th>120V</th>
<th>220V</th>
<th>230, 240V</th>
</tr>
</thead>
<tbody>
<tr>
<td>Range of voltage</td>
<td>108 ~ 120V</td>
<td>118 ~ 130V</td>
<td>218 ~ 240V</td>
<td>235 ~ 260V</td>
</tr>
</tbody>
</table>

Table 10-1

10-3 MEASURING DC OUTPUT

Measurement is made of the DC output of the generator with the switch shown in the above circuit turned on, while the generator is kept running at its rated speed. The DC output should be within 11 to 14V, with the current regulated at 8.3A by adjusting the load connected to the generator.

**NOTE:** If a battery is connected as a load to the generator, the DC output voltage will increase by approximately 1 to 2V. Therefore, carefully observe the electrolyte level and do not overcharge the battery.

10-4 MEASURING INSULATION RESISTANCE

To measure insulation resistance, connect the megger tester across either one of the two output terminals of the socket and the earth terminal. When the measured insulation resistance of the generator is over 1MΩ, it is normal (over 10MΩ at time of shipment).

(Be sure to turn on the circuit breaker when measuring insulation resistance.)

If the insulation resistance is less than 1MΩ, disassemble the generator, and measure the respective resistances of the stator, rotor, and control panel.
10-4-1 STATOR
Measure the resistances between red coupler leading from the stator and the core.

10-4-2 ROTOR
Measure the insulation resistance across one of the soldered terminals of the rotor and the core.

10-4-3 CONTROL PANEL
Measure the insulation resistances between the live parts and the grounded part.
If the measured resistance of a component is below 1MΩ, the insulation is defective.
Promptly replace the defective component because there may be leakage of current from the generator and a potential danger of electrical shock.
11. FUNCTIONAL CHECK of EACH COMPONENT

11-1 CONTROL PANEL

11-1-1 ENGINE SWITCH
Using the circuit tester, check continuity across the black and green top terminals of the 6P coupler. When continuity between the terminals is confirmed with the engine switch turned off, the switch is normal. It is also normal if there is no continuity between these terminals when the engine switch is set at RUN or CHoke position.

11-1-2 FREQUENCY METER
Also check with the circuit tester, the continuity across the yellow and blue top terminals of the 6P coupler. If continuity is confirmed between these terminals, the frequency meter is normal.

11-1-3 PILOT LIGHT
Using the circuit tester, check continuity between the red and yellow top terminals of the 6P coupler.
11-1-4 AC RECEPTACLES
Using the circuit tester, check continuity between the two terminals at the rear of the AC receptacles while the receptacle is mounted on the control panel. When continuity is confirmed between the output terminals of the receptacle with a wire connected across these terminals, the AC receptacle is normal. When the wire is removed and no continuity is confirmed between these terminals, the receptacles are also normal.

![Fig. 11-4(A)](image1)

![Fig. 11-4(B)](image2)

11-1-5 DC TERMINALS
Using the circuit tester, check continuity between the DC terminals at the rear side of the control panel while they are mounted on the panel.
When continuity is confirmed between the DC terminals with a wire connected across these terminals, the DC terminals are normal. When the wire is removed and no continuity is confirmed between these terminals, the terminals are also normal.

![Fig. 11-5](image3)

11-1-6 CIRCUIT BREAKER
Check continuity between each of two terminals at the rear of the circuit breaker while it is mounted on the control panel. Normally, there is continuity between each of the two when the circuit breaker is on while there is no continuity when the circuit breaker is off.

![Fig. 11-6](image4)
11-2 STATOR

Measure the resistance of each stator coil using the circuit tester.

Table 11-1 (at 21°C)

NOTE: If the circuit tester is not sufficiently accurate, it may not show the values given and may give erroneous readings. Erroneous readings will also occur when there is a wide variation of resistance among coil windings or when measurement is performed at ambient temperatures different from the values specified in the space directly upper the table.

[6P coupler wiring]
11.3 ROTOR
1) Using the circuit tester, measure the resistance of the field coil.

</tr>
</tbody>
</table>

*Table 11-3*
11-5 CONDENSER
Measurement of capacity substitutes for checking the condenser. The capacity of the condenser cannot be measured by using the circuit tester. Therefore, the generator is run with a new condenser to see whether or not the generator performs normally. If the generator performs normally, the condenser is normal.

Reference: If an instrument is available for measuring the capacity of the condenser, the total capacity range should be 10 to 11 μF (at 20°C).

When the condenser displays its total capacity within this range, it is normal.

11-6 RECTIFIER
Using the circuit tester, measure the resistance between each of the two terminals of the rectifier. The rectifier is considered normal when the respective resistances have the values specified below.

NOTE: Each of the given values changes with the polarity of the circuit tester.

12. DISASSEMBLY and ASSEMBLY

12-1 PREPARATION and PRECAUTIONS

1) Be sure to remember the locations of individual parts when disassembling the generator so that the generator can be reassembled correctly. Tie tags noted with the necessary information to facilitate easier and smoother reassembly.

2) For more convenience, divide the parts into several groups and store them in boxes.

3) To prevent bolts and nuts from being misplaced or installed incorrectly, place them temporarily back at their original positions.

4) Handle disassembled parts with care; clean them before reassembly using a neutral cleansing fluid.

5) Use all disassembly/assembly tools properly, and use the right tool for each specific job.

### Sequence 16: Rotor assembly

**Description:**
Fit the rotor puller to the rotor shaft, and drive it into place to remove the rotor from the engine shaft.

**Precautions:**
- Necessary tools: Rotor puller, Plastic hammer

### Sequence 17: Plug cap

**Description:**
- Remove the plug cap from the spark plug in advance.
- Remove the clamp of the high-voltage power cable.

**Precautions:**

### Sequence 18: Front housing and center baffle

**Description:**
Remove the front housing and center baffle from the engine main bearing. By removing three M6 x 25mm bolts and one M5 x 55mm bolt.

**Precautions:**
- Necessary tools: 10mm box spanner

### Sequence 19: Air cleaner

**Description:**
- Remove the center screw of the air cleaner cover to remove the cleaner cover, filter element, and element retainer.
- Remove the M5 screw at the lower right inside the element chamber.
- Remove two M6 flange nuts clamping the air cleaner and the carburetor together to remove the air cleaner.

**Precautions:**
- Necessary tools: Minus screwdriver, Plus screwdriver, 10mm box spanner

12-4 ASSEMBLY PROCEDURE

- Precautions in Assembly

1) Thoroughly clean each part. When cleaning, take special care for the piston, cylinder, crankshaft, connecting rod, and bearings.

2) Be sure to completely remove the carbon deposits on the cylinder head and piston head. Also, thoroughly clean and remove carbon deposits from each piston ring groove.

3) Apply lubricating oil to the lip of each seal. Confirm that the lip of each oil seal is not damaged. If damaged, replace with new one.

4) Replace the gaskets and similar items with new ones; do not reuse old gaskets.

5) Replace the keys, pins, bolts, nuts, etc., with new ones if necessary.

6) Do not apply torque exceeding the specified value.

7) Apply lubricating oil to both moving and sliding parts when they are assembled.

8) Prior to assembly, check the clearance of each part, and adjust it if necessary.

9) When each of the main components are assembled, turn it by hand to check for smoothness of rotation and unusual noise.

- Assembly Sequence and Precautions

12-4-1 GOVERNOR SHAFT

Put the governor shaft into crankcase, then drive the clip into position to secure the governor shaft.

12-4-2 CRANKSHAFT

1) Insert the crankshaft into the ball bearings of the crankcase.

2) Fig. 10-4-1 shows the dimensional tolerance of the crankpin.

L = Loose  T = Tight

Table 12-2

NOTE: The clearance between the piston and cylinder is checked by measuring the clearance between the piston and cylinder skirt.

12.4.3 PISTON and PISTON RINGS

1) If a ring expander is not available, set the ring joint at the first land of the piston, as shown in Fig. 12-11 so that the ring can be slid into its groove.

NOTE: Be careful not to twist or expand excessively each ring. The oil ring is fitted first on to the piston, followed by the second ring and top ring. The top and second rings must be fitted with their marked sides kept upward.

Fig. 12-11

2) The connecting rod is joined to the piston by the piston pin.

NOTE: Before assembly, apply sufficient lubricating oil to the connecting rod minor end.

NOTE: Be sure to fit the clips to both sides of the piston pin.
12-4-4 INSTALLING THE CRANKCASE

1) The connecting rod is put into the cylinder while holding it with the piston ring guide, as shown in Fig. 10-13 (in the case that a piston ring guide is not available, press rings inward with fingers and at the same time, strike down the piston, using a wooden block). The connecting rod must be mounted in place with its 7 and MA marks directed to the ball bearing side of the crankcase.

*NOTE:* Apply a sufficient quantity of oil to the piston rings, connecting rod surfaces, and cylinder.

*NOTE:* The top, second and oil rings are fitted to the piston with their ring joints arranged 90° off each adjacent joint.

12-4-5 INSTALLING THE CONNECTING ROD MAJOR END CAP

1) Manually turn the crankshaft until the piston reaches top dead center. Gently strike down the piston head until the connecting rod touches the crankpin to install the connecting rod major end cap.

2) The cap is installed with the oil scraper positioned right-downward. (See Fig. 12-14.)

*NOTE:* Be sure to use a new lock washer; and carefully bend the washer correctly.

*NOTE:* When the cap has been installed, turn the crankshaft to see if the connecting rod moves smoothly.

*NOTE:* The correct torque for installing the connecting rod major end cap is 60 to 80 kg-cm.

*NOTE:* See Table 12-2 for details regarding the clearances between the piston, piston rings, and connecting rod and their counterparts.
12-4-6 INSTALLING THE TAPPETS and CAMSHAFT
Install the tappets, and then the camshaft.

NOTE: Align the timing mark at the base of the cam gear with the timing mark of the crank gear. If the valve timing is set incorrectly, the engine will not run or operate properly. (See Fig. 12-15.)

NOTE: If the intake and exhaust valves are installed in reverse order, tappet clearance will be incorrect.

Fig. 12-15

12-4-7 INSTALLING THE MAIN BEARING COVER
Install the main bearing cover to the crankcase.

NOTE: The governor gear is already mounted to the bearing cover; therefore, it is necessary to confirm that the governor gear is meshed with the cam gear. (See Fig. 12-16.)

If the oil seal requires replacement, pressure-fit the new oil seal in position before installing the main bearing cover.

NOTE: Prior to installation, apply oil to the bearing and oil seal. Apply a small amount of oil to the cover fitting face, as specified, in preparation for installing the bearing cover packing. Place the oil seal guide over the crankshaft so that the oil seal lip will not be damaged during installation. Make sure that the side clearance of the crankshaft is within 0 to 0.2mm. If necessary, adjust the clearance, using the adjusting collar. (see Fig. 12-17.)

NOTE: Torque for the main bearing cover: 80 ~ 100 kg·cm.
Shown in Fig. 12-18 is the method to measure the side clearance of the crankshaft. According to this method, measure the clearance between the machined face of the crankcase and the adjusting collar. The machined face of the crankcase is mounted with packing so it is necessary to set the clearance properly by allowing for a packing thickness of 0.22mm.

M6 x 25mm bolt ............ 8 pcs.
M6 x 55mm bolt ............ 1 pc.

12-4-8 INSTALLING THE INTAKE and EXHAUST VALVES
Prior to installing, remove carbon and gum deposits, from the valve, valve seat, intake and exhaust ports, and valve guide.

**NOTE:** If the valve face is worn, replace the valve with a new one.

**NOTE:** If the clearance between the valve guide and valve stem is excessively large, replace the valve guide with a new one.

Replace the valve guide by using a pull block and pull bolt as shown in Fig. 12-20.

Table 12-3

L: LOOSE
12-4-9 TAPPET ADJUSTMENT

Set the tappet at the lowest position to depress the valve. Then measure the clearance between the valve and tappet stem, using a clearance gauge inserted into the clearance. (See Fig. 12-21.)

**NOTE:** As with the intake and exhaust valves, the clearance between the valve and tappet stem must be within 0.1 ± 0.02.

![Fig. 12-21]

![Fig. 12-22]

**NOTE:** If the clearance is smaller than that specified, slightly grind down the valve stem end using a grinder, then measure the clearance.

If the clearance is larger than that specified, replace the valve with a new one. Spot the valve seat and use some compound to adjust the clearance.

**NOTE:** After completing adjustment of tappet clearance, install the valve spring retainers, and then recheck the tappet clearance.

*Installing the valve spring retainer:*

Using the special tool, place the retainer over the valve stem with the notch in the outside periphery of the retainer kept toward the front.

12-4-10 INSTALLING THE CYLINDER HEAD

Before reinstalling the cylinder head, be sure to remove carbon deposits from the combustion chamber, and clean between the cooling fins. Also check the cylinder head for levelness.

**NOTE:** Replace the cylinder head gasket with a new one.

The cylinder head is installed using seven M6 x 32mm bolts.

**NOTE:** Torque for each cylinder head lock bolt: 90 ~ 110 kg-cm

12-4-11 INSTALLING THE SPARK PLUG

Torque for spark plug: 170 ~ 150 kg-cm

12-4-12 INSTALLING THE CYLINDER BAFFLE

The cylinder baffle is installed to the crankcase, using the M6 x 20mm screw and to the main bearing cover, using the M5 x 10mm screw. The cylinder baffle and fuel line clamp are installed, together to the crankcase.
12-4-13 INSTALLING THE HEAD COVER
The head cover is installed over each of the left and right parts of the cylinder head, using the M5 x 10mm screws.

12-4-14 INSTALLING THE GOVERNOR and RELATED PARTS
Model EY08D has a centrifugal weight type governor which is installed while engaged with the governor gear. With the governor, the throttle valve of the carburetor is controlled automatically by using a lever link mechanism. Therefore, engine speed is constantly maintained even under load variations.

1) Using two M6 x 10mm bolts, install the speed control assembly to the crankcase.
2) Temporarily install the carburetor with two M6 flange nuts.
3) Join the throttle lever of the carburetor to the governor rod and rod spring.
4) Insert the governor lever into the governor shaft.
5) Insert a minus screwdriver into the groove of the governor shaft, and turn the screwdriver fully in the counterclockwise direction. Push the governor lever clockwise (at this time, the throttle valve is fully opened) and fasten the governor lever with the lock bolt.
   Torque for the governor lever: 70 ~ 90 kg-cm
6) Link the governor lever and speed controller with the governor spring, one end of which is inserted into the center hole (of the three) of the governor lever and the remaining end inserted into the hole of the speed controller.

12-4-15 INSTALLING THE CARBURETOR and AIR CLEANER
Place the carburetor gasket, insulator, gasket, and carburetor in the correct positions. Next, fit the air cleaner gasket and air cleaner case, and install them, using the M6 flange nut and M5 x 10mm screw. Set the element (small type), element retainer, element, and cleaner cover, and tighten them with screws (slot head type).
Torque for installing the carburetor and air cleaner: 50 ~ 60 kg-cm

NOTE: See page 10-26 for details concerning disassembly and assembly of the carburetor.
12-4-16 INSTALLING THE CENTER BAFFLE and FRONT HOUSING
1) Set the knock hole of the front housing to the knock of the main bearing cover and assemble them together. During assembly, place the center baffle between the main bearing cover and front housing.
   Torque for the front housing: 80 ~ 100 kg-cm

12-4-17 INSTALLING THE IGNITION COIL
1) Install the ignition coil and grommet (IG-COIL) to the front housing. Simultaneously, temporarily set the generator rotor in position. And assemble the ignition coil and magnet together while adjusting the air gap between the two to 0.4 to 0.5 mm.
   Firmly bond the grommet to the front ensuring that there is no residual clearance. (use CEMEDINE 575).
2) Fit the plug cap on the spark plug.

12-4-18 INSTALLING THE ROTOR ASSEMBLY
Install the rotor assembly to the taper of the crankshaft with their keyways in line.

NOTE: Thoroughly clean the tapers (both male and female tapers) of oily substances.

12-4-19 INSTALLING THE STATOR ASSEMBLY
1) Install the stator correctly into the recess of the rear housing. Note the leads and their positions.
2) Install the wiring between the stator and rear housing.
   Connect the wires from the stator to the capacitor (with these wires joined to two black top terminals).
   Also connect the wires from the stator to the rectifier (with these wires joined to three terminals).

   Refer to paragraph 9-2 for (c).

   Connect the ground cord to the rear housing using one M6 x 8mm screw.
3) Install the stator assembly correctly into the recess of the front housing. If necessary, softly strike the rear housing with a plastic hammer (be careful not to strike the capacitor and diode).
4) Fasten the front housing to the rear housing of the stator assembly, using three M6 bolts, while the three bosses of the front housing are set to their counterparts of the rear housing.
   Torque for each bolt: 65 ± 10 kg-cm
5) Clamp the lead of the 6P x coupler and the lead from the ignition coil to the bolts specified in paragraph d above, using the wire bands.

12-4-20 INSTALLING RUBBER MOUNT (A)
1) Fit rubber mount (A) to the bosses (two) at the lower center of the crankcase.
2) Also fit another rubber mount (A) to the bosses at the lower part of the stator assembly of the generator.

12-4-21 INSTALLING THE STARTER PULLEY
Install the starter pulley to the rotor shaft using the rotor through bolt.
   Torque for the through bolt: 100 ~ 150 kg-cm

12-4-22 INSTALLING THE RECOIL STARTER
Install the recoil starter to the rear housing using the M6 flange bolt.
12.4.23 RUBBER TUBES for USE as AIR VENTS
Connect two rubber tubes to the air vent connectors of the carburetor. Keep these rubber tubes suspended downward from the air vent connectors.

12.4.24 INSTALLING THE BASE FRAME
1) Install the base frame with its rear side facing the welded nut area of rubber mount (A). Match the rubber mount (A) which is fitted to the lower part of the engine and generator. Base frame is installed using four M5 bolts.
2) Insert each rubber tube from the air vent connector of the carburetor into the hole in the base frame.
3) Fasten the ground terminal of the 200V power system to the rear housing using the M6 bolt.

12.4.25 INSTALLING THE MUFFLER and MUFFLER COVER
1) Fit the gasket (for the muffler cover) to the studs of the exhaust flange of the crankcase.
2) Using the M5 screws, install the muffler cover in place.
   NOTE: Be careful not to drop the screws into the cooling air channel.
3) Set the gasket (for the exhaust port) on the studs of the exhaust port flange. Then, mount the asbestos sheets to the upper and lateral sides of the muffler. The muffler is installed while secured to the muffler flange using two M6 nuts, and also to the muffler bracket by using one M6 bolt.
4) Install the outer muffler cover place using seven M5 tapping screws.
   Torque: 70 ~ 90 kg-cm

12.4.26 INSTALLING THE CHOKE CABLE
1) Insert the inner wire of the choke cable into the swivel of the choke lever.
2) Insert the outer end of the choke cable into the wire bracket of the head cover; temporarily tighten the outer end so that it will not slip out of the wire bracket.
   NOTE: The inner wire is installed later. Leave it loose in the swivel.

12.4.27 INSTALLING THE FUEL LINE
1) Connect the fuel line to the line connector at the fuel supply port of the carburetor. Then, fasten the line so that it will not come off the line connector.
2) Secure the fuel line with the clamp of the cylinder baffle.

12.4.28 INSTALLING THE FRONT COVER
Using two M6 x 8mm flange bolts, install the front cover installed with the control panel to the base plate. Keep the engine switch set at STOP.

12.4.29 INSTALLING THE FUEL TANK
1) Keep the strainer shaft at the lower part of the fuel tank in a position that will allow the set screws to be tightened from the opposite direction of the muffler.
2) Insert the flexible shaft extending from the rear side of the engine switch which is mounted on the control panel into the square hole of the strainer shaft.
3) Align the mounting holes at the lateral side of the front cover with those in the bracket which are bolted to the fuel tank. Then, install the fuel tank using two M6 x 8mm flange bolts.
4) Make sure that the flexible shaft on the control dial side is inserted in the square hole of the strainer shaft, then fasten the flexible shaft.

12-4-30 INSTALLING THE REAR COVER
Align the mounting holes at the lateral side of the rear cover with those in the fuel tank bracket. Then install the rear cover using two M6 x 8mm flange bolts. Also align the holes at the lower part of the rear cover with those in the base plate, and install the rear cover by two M6 x 8mm flange bolts.

12-4-31 INSTALLING THE FUEL TANK HANDLE
1) Set the bolt (to secure the tank handle) in the handle and assemble the O-ring to this bolt from the opposite side. Then, tighten the bolt to install the handle to the fuel tank.
   \textit{NOTE: Be sure to direct the less slanted part of the handle toward the front cover.}
2) Insert the rubber tube end over the protrusion of the bolt (for the fuel tank) and push it down to the base of the protrusion.
   \textit{NOTE: Be sure to keep the air bleed hole at the center of the rubber tube directed upward.}
3) Place the handle cover over the handle.

12-4-32 INSTALLING THE FUEL LINE
Insert the fuel line end over the fuel strainer joint (be sure to push the line end down to the joint base), and secure it with the clamp.

12-4-33 INSTALLING THE CHOKE CABLE
1) Insert the choke cable adjusting screw in its hole on the fuel tank bracket.
2) Secure this adjusting screw with the M6 nut and tighten to the midway point of the threaded part.
3) Set the dial of the control panel to \textit{STOP}, and connect the locknut of the choke cable end to the panel.
4) Pull the inner wire of the choke cable to clamp the wire to the choke lever, using the setscrew.

12-4-34 CONNECTING THE COUPLERS TOGETHER
Connect the coupler (6P) from the generator to the coupler (6P) extending from the control panel. Also connect the stop wire (green) as required.

12-4-35 INSTALLING THE LEFT AND RIGHT SIDE COVERS
Using the M5 flange screws, install the left and right side covers in place.
12-5 CABURETOR
12-5-1 FUNCTION and COMPONENTS (See Fig. 12-28)

1) Float system

The float chamber is located directly under the carburetor. Float and needle valves maintain a constant fuel level inside the float chamber.

The fuel in the tank flows into the float chamber from the needle valve. When a certain quantity of fuel enters the chamber, the float rises. When the buoyancy of the flat valve balances with the fuel in-flow pressure of the needle valves, the valves close to keep the fuel at the correct level.

Schematic diagram of the fuel system

Fig. 12-28
2) Pilot jet nozzle system

The pilot jet nozzle system controls the fuel supply for engine speeds ranging from idle to low-speed running. The system operates with the fuel flowing through the main jet nozzle and up to the pilot jet nozzle where the fuel is measured. When the fuel is mixed with air, the volume of the air-fuel mixture is also measured by the pilot air jet. From this stage, the mixture is supplied to the engine from the pilot outlet and bypass. During idle, fuel is supplied mainly from the pilot outlet.

3) Main jet nozzle system

The main jet nozzle system supplies fuel for middle and high-speed operation. The fuel flows to the main jet nozzle where the fuel quantity is measured, and then flows to the main nozzle. Air volume, which is measured by the main air jet, enters from the bleed hole of the main nozzle and mixes with fuel to form a gas mist. The gas mist flows out of the main bore and is again mixed with air from the air cleaner. From this stage, the correct air-fuel mixture is supplied to the engine.

4) Choke

The choke helps in starting the engine in cold weather.

When the engine is started with the choke valve closed, negative pressure applied to the main nozzle rises, allowing most of fuel to flow through the main nozzle.

A mixture with a high gasoline concentration is fed to the engine resulting in easier engine starting.

126-2 DISASSEMBLY and ASSEMBLY of CARBURETOR

The most common trouble with the carburetor is failure to provide the correct air-fuel mixture. This is generally caused by blockage in the air and fuel channels, at other times it is caused by fuel level fluctuations in the float chamber. In order to maintain the carburetor in normal operating condition, it is vital that the air and fuel channels be kept clean. The following descriptions are the procedures for carburetor disassembly and assembly. (See Fig. 12-29.)

1) Throttle mechanism

a) Remove Philips-head screw (77), throttle valve (78), and pull out the throttle shaft (79).

b) When removing the throttle stop screw, a spring (31) will also come off. Be careful when handling the throttle valve to prevent the valve edge from damage.

2) Choke

a) Remove Philips-head screw (22), choke valve (23), and pull out choke shaft (24).

b) Be sure to keep the notch of the choke valve positioned forward the main air jet side when the choke shaft is installed.

3) Pilot jet nozzle

a) Remove pilot jet nozzle (21). When removing, use a proper tool so that the nozzle will not be damaged.

b) Firmly secure the jet nozzle when the carburetor is assembled. Otherwise, fuel will leak from the nozzle and cause engine trouble.

4) Main jet nozzle

a) Remove bolt (15), and float chamber body (13).

b) Remove main jet nozzle (19) from carburetor body (9).

c) Firmly secure the main jet nozzle when assembling. Otherwise, air-fuel mixture will become excessively rich and the engine will not operate properly.

d) Torque for bolt (15) is 70 kg-cm.
5) Float system

Pull out float pin (12) and remove float (11) and needle valve (20).

* Avoid using a drill or a wire to clean the fuel passages (they may damage the orifice of the pilot and main jet nozzles). Use compressed air.

* The float pin is peen-secured to the carburetor body; the needle valve and float can be removed out from the opposite side of the peen-secured part by lightly striking the float pin with a thin bar-like object.
13. TROUBLESHOOTING

DIAG: DIAGNOSIS

- **DIAGNOSIS BY THE CUSTOMER**
  1) DIAG. 01 Engine fails to start.
  2) DIAG. 02 Electricity not generated.

  If the generator doesn’t perform properly or fails to run after troubleshooting, ask a qualified service dealer to check it.

- **DIAGNOSIS BY THE SHOP**

  A. Fails to start
  3) DIAG. 11 The fuel tank is empty
  4) DIAG. 12 Contaminated by water or dirt
  5) DIAG. 13 Spark is weak of wire harness
  6) DIAG. 14 Spark is strong of wire harness
  7) DIAG. 15 Compression is insufficient
  8) DIAG. 16 Compression is nonexistent
  9) DIAG. 17 Clogged fuel pipe
  10) DIAG. 18 The fuel doesn’t enter into the carburetor (No flow from the pipe)
  11) DIAG. 19 The fuel doesn’t enter into the float chamber (Flow from the pipe)
  12) DIAG. 20 The fuel doesn’t enter into the combustion chamber (Fuel exists in the float)
  13) DIAG. 21 Carburetor flooded

  B. Engine defective
  14) DIAG. 31 Excessive noise (Improper maintenance) ... Check oil element
  15) DIAG. 32 Oil consumption increases (gets thin)
  16) DIAG. 33 Excessive noise occurs and engine suddenly stops
  17) DIAG. 34 Black exhaust fumes (Excessively large fuel consumption)
  18) DIAG. 35 White fumes produced (Excessively large lubricating oil consumption)

  C. Control Panel
  19) DIAG. 36 Pilot light fails to light up
  20) DIAG. 37 The frequency meter fails to show any reading, with the needle resting at zero

  D. Engine operates but voltage is not normal
  21) DIAG. 41 No AC voltage is output (Resistance load)
  22) DIAG. 42 No DC voltage is output (Resistance load)
  23) DIAG. 43 No DC voltage is output
  24) DIAG. 44 The DC output voltage is only 50% of the rated value
  25) DIAG. 45 130% higher or more DC is output
  26) DIAG. 46 No AC voltage is generated
  27) DIAG. 47 AC output voltage is only 20% of the rated value

  E. Power lacking and performance poor
  28) DIAG. 51 Poor operating condition
  29) DIAG. 52 Engine speed does not increase
  30) DIAG. 53 Knocking, engine overheats
  31) DIAG. 54 Failure to generate output, no compression
  32) DIAG. 55 Poor performance (Backfire)
  33) DIAG. 56 Misfire or combustion outside the combustion chamber
DIAG. 11
Symptoms
- Engine fails to start
  - Check fuel quantity

Parts
- Fuel tank
- Fuel strainer

Possible causes
- Empty fuel tank
- Moisture or dust in the fuel

Items to check and procedure
- Check
- Check the air gap
  - Searcher
- Measure the coil resistance
  - Circuit tester

Checking criteria
- No fuel
- Moisture or dust exists
- Air gap is too wide
  - Standard is 0.4~0.5

Remedies
- Fill with fuel
- Replace fuel
- Adjust and reform
**DIAG. 15**

**Symptoms**
Engine fails to start
Compression insufficient

**Parts**
- Valve seat
- Piston ring
- Cylinder
- Cylinder head
- Spark plug
- Gasket (Head spark plug)
- Valve (Intake exhaust)
- Valve (Intake exhaust)

**Possible causes**
- The seat faces are defective
- Worn out
- Worn out
- The mating faces are cylinder & crankcase are defective
- Not secured tightly
- Damaged gasket
- Sticky
- Overstroke range

**Items to check and procedure**
- Check
- Check the clearance of piston ring
- Measure the diameter of the bore
- Measure degree of levelness
- Check the gasket
- Check
- Oil valve stem and move smoothly
- Grind the end of the valve and adjust the tappet space

**Checking criteria**
- Seat dented or not equal. Too much clearance
- Over the service limit
- Over the service limit
- Not level
- Not secured tightly
- Gasket defective
- Damaged gasket or overstroke range
- Sticky
- Narrow ...
- Wide ...
- Replace

**Remedies**
- Replace
- Replace
- Re bore
- Repair or replace
- Tighten or replace
- Replace gasket
- Oil valve stem or replace
- Repair or replace

**DIAG. 16**

Engine fails to start
No compression is detected

Engine fails to start
No compression is detected
**Symptoms**

Engine fails to start
Check if fuel pipe is clogged?

**Parts**

Air bleed (Fuel tank)
Fuel strainer and filter
Fuel strainer
Fuel pipe
Fuel filter

**Possible causes**

The air bleed is clogged
The air bleed is clogged
Closed position
Accumulation of air
Defective fuel filter

**Items to check and procedure**

Check the bolt of rubber pipe in the handle
EXAM 31
Check
Check
Check
Check

**Checking criteria**

The air bleed is clogged
Damaged
Closed position
Air bubble exists
Defective fuel filter

**Remedies**

Clean
Clean or replace
Set in the closed position
Vent the air
Clean the filter element or replace the strainer

**DIAG. 17**

No fuel flows out even when the fuel pipe is disconnected from the carburetor

**DIAG. 18**

Engine fails to start Fuel does not enter into the carburetor
**Symptoms**
- Engine fails to start
- No fuel flows into the float chamber of the carburetor

**DIAG. 19**
- Fuel present in the float
- Fuel present to the pipe

**Parts**
- Needle valve (Carburetor)
- Carburetor
- Gasket (Intake)
- Combustion chamber
- Needle valve (Carburetor)
- Float (Carburetor)
- Float (Carburetor)
- Air vent (Within the handle)

**Possible causes**
- The float valve fails to open
- The fuel passage inside the carburetor is clogged
- Restricted air flow
- No Compression
- Defective float valve
- Damaged float
- Fuel level improperly set
- Closed air vent

**Items to check and procedure**
- Check (Try to move)
- Check
- Check (Try to move)
- Check
- Check

**Checking criteria**
- Movement of valve defective
- Dirt in fuel passage
- Gasket is defective
- Contaminated or valve bent
- Level is too low
- Level is too high
- Damaged air vent hole

**Remedies**
- Clean or replace
- Clean
- Tighten or replace
- Clean or replace
- Replace the float
- Adjust the float
- Clean the air vent

**Measure the float height.**
- The specification is 15.5 mm from body
**DIAG. 31**

- **Symptoms**
  - Engine operation abnormal
  - Excessive noise (Maintenance is defective)

- **Parts**
  - Piston valve
  - Connecting

- **Possible causes**
  - Excessively worn sliding parts (Use of old oil)
  - Excessively worn sliding parts (Change the oil)

- **Items to check and procedure**
  - Check the compression To DIAG. 15 or 16

- **Checking criteria**
  - Damage

- **Remedies**
  - Use oil higher than SC class

**DIAG. 32**

- **Symptoms**
  - Engine operation abnormal
  - Lubricating oil consumption increases (gets thin)

- **Parts**
  - Carburetor
  - Piston ring
  - Fuel

- **Possible causes**
  - Long operation with in small load (Rich mixture) (Misfire is observed)
  - Ring worn out
  - Defective fuel

- **Items to check and procedure**
  - Check the jet (Jet number, looseness)
  - Ring clearance Check the clearance of piston ring
  - Replace with normal fuel and check

- **Checking criteria**
  - Over the service limit
  - DistortedWrong jet

- **Remedies**
  - Clean or replace Clean every 50 hours
  - Tighten or replace
  - Replace
**DIAG. 33**

**Symptoms**
- Engine operation abnormal
- Noise produced and stops abruptly

**Parts**
- Piston, connecting rod

**Possible causes**
- Seizure or damage of the piston or connecting rod

**Items to check and procedure**
- Check

**Checking criteria**
- Seizure or damage of the piston or connecting rod

**Remedies**
- Repair or replace

---

**DIAG. 34**

**Symptoms**
- Engine operation abnormal
- Black exhaust fumes
- Excessively large fuel consumption

**Parts**
- Cleaner element
- Carburetor
- Fuel

**Possible causes**
- Clogging of the air cleaner element
- Rich mixture
- Fuel mixed with foreign substances

**Items to check and procedure**
- Check
- Check the main jet for looseness and jet number
  - To DIAG. 21
- Distorted...
  - Tighten
  - Wrong jet
  - To DIAG. 21
- Dirt
- Clean the element
- Wash
- Replace
- Tighten, adjust or replace

**Checking criteria**
- Distorted...
  - Tighten
  - Wrong jet
  - To DIAG. 21
- Dirt
- Clean the element
- Wash
- Replace
- Tighten, adjust or replace

**Remedies**
- Replace fuel
**Symptoms**
Control panel
The pilot light fails to light up.

**Parts**
- Stator DC coil
- Rectifier
- Light
- Lead wire
- Stator main coil for the frequency meter

**Possible causes**
- Wire broken or shorted
- The diode is defective
- The filament is broken
- Defective solder, and lead broken
- Wire broken or shorted

**Items to check and procedure**
- Measure the resistance (Across the terminals) Circuit tester
- Measure the resistance (Across the terminals) Circuit tester
- Check the soldered part Circuit tester
- Measure the resistance (across the terminals) Circuit tester
- Check the frequency meter for electrical continuity

**Checking criteria**
- When \( \infty \Omega \) ...
- Wire broken
- When 0\( \Omega \) ...
- Shorted
- When \( \infty \Omega \) ...
- The reading of the circuit tester is \( \infty \), the lead and solder are defective
- When \( \infty \Omega \) ...
- Wire broken
- When 0\( \Omega \) ...
- Shorted
- When \( \infty \Omega \) ...
- Wire broken

**Remedies**
- Replace the stator
- Replace the rectifier
- Replace the light
- Replace the lead, and repair the soldered part
- Replace the stator
- Replace the frequency meter

**DIAG. 36**

- Symptoms
- Parts
- Possible causes
- Items to check and procedure

Checking criteria

No AC voltage is produced

AC voltage is low by 20%

AC voltage is 130% over limit

No DC voltage is generated

DC voltage is low by 50%
Symptoms
130% higher or more DC is output
Engine running speed is high

Parts
Engine
Condenser
Stator main coil
Stator condenser coil
Rotor

Possible causes
The engine running speed is higher than normal
Aged, broken, or defective joint of condenser's joint connector
Wire broken or shorted
Wire broken or shorted
1. Wire broken shorted
2. Rotor resistor is defective
3. Rotor diode is defective

Items to check and procedure
To DIAG. 52
Check the governor
Measure the capacity (circuit tester can not be used for this measurement)
Measure the resistance (between the terminals) The circuit tester
Measure the resistance (between the terminals) The circuit tester
Measure the resistance across the resistors, with solder removed. Measure the resistance of the rotor resistor, and check the diode for normality

Checking criteria
Different from the standard value
When \( \approx \Omega \) ...
When 0\( \Omega \) ...
Wire broken
Shorted
When \( \approx \Omega \) ...
When 0\( \Omega \) ...
Wire broken
Shorted
When \( \approx \Omega \) ...
When 0\( \Omega \) ...
Wire broken
Shorted

Remedies
Replace the condenser
Replace the stator
Replace the stator
Replace the rotor
**DIAG. 47**

**Symptoms**

- AC output voltage is only 20% of the rated value

**Parts**

- Stator main coil
- Stator condenser coil
- Rotor
- Condenser
- Engine

**Possible causes**

- The coil is shorted
- The coil is shorted or aging of the rotor resistor
- Aged or broken
- The engine speed is lower than normal

**Items to check and procedure**

- Measure the resistance (6P coupler terminals) Circuit tester
- Measure the resistance (between terminals) Circuit tester
- Measure the resistance of the coil or aging of the rotor resistor
- Measure the capacitance (the circuit tester cannot be used for this measurement)
- To DIAG. 52 Check the governor

**Checking criteria**

- The resistance is 15% lower than the standard value ... Shorted
- The resistance is 15% lower than the standard value ... Shorted
- 15% lower than the coil standard ... Shorted
- 10% difference than the resistor standard ... Old
- Different from the standard value
- Aged
- Broken

**Remedies**

- Replace the stator
- Replace the stator
- Replace the rotor
- Replace
Symptoms

Parts
  Governor
  Valve
  Carburator and air cleaner
  Exhaust port and muffler
  Electrical load

Possible causes
  Defective setting
  The timing of the valves is defective.
  Mixture is incorrect.
  The exhaust port and muffler are clogged.
  Overloading

Items to check and procedure
  Check the setting
    EXAM 54
  Check the tappet clearance
    EXAM 49
  Check the carburator.
    EXAM
    Check the aircleaner owner's manual
  Check by eyes
  Correct to the standard load
    AC; To DIAG 46
    DC; To DIAG 43

Checking criteria
  The governor is incorrectly set, interfering with the throttle valve's opening.
  Adjustment of clearance is incorrect
  Contamination
  Overload

Remedies
  Adjust the governor set.
  Adjust the clearance.
  Adjust the carburator, and clean the air cleaner element.
  Clean them.
  Usage of standard load
Symptoms

Parts
- Cylinder head and cylinder
- Cylinder head muffler
- Carburetor
- Spark plug

Possible causes
- Cooling fans are clogged.
- Accumulation of carbon
- Lean mixture
- Overloading
- Thermal rating of the spark plug is not adequate.

Items to check and procedure
- Check
  - Cylinder head EXAM 50
  - Muffler EXAM 65
- Overhaul and check the carburetor.
- Air compressor EXAM
- Measure the insulation resistance.
  - Adjust to the standard load
  - AC: To DIAG 46
  - DC: To DIAG 43
  - Check
    - Specify BMR-4A (NGK)
    - EXAM 51

Checking criteria
- Soil and other foreign substances present
- Accumulation of carbon
- Dirt and clogging
- Overload
- Thermal rating of the spark plug is not adequate.

Remedies
- Remove and clean
- Remove the carbon deposit.
- Clean the carburetor.
- Usage of standard load.
- Replace with the specified plug.

16. MAINTENANCE

The following standard maintenance procedures are necessary to ensure the generator's normal performance under normal operating conditions. Therefore, the instructions described below are for reference only and vary depending on how the generator is operated. For instance, if the generator is operated in a dusty area the air cleaner must be cleaned daily which differs from the interval specified below.

16-1 DAILY CHECKS and MAINTENANCE (every 8 hours)

<table>
<thead>
<tr>
<th>Check and maintenance items</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>(1) Clean each component of dust</td>
<td>(1) If the joint of the governor is left in a dusty condition, the governor may fail to function normally.</td>
</tr>
<tr>
<td>(2) Check the fuel piping system and related parts for leakage. Should leakage be detected, tighten or replace the defective part.</td>
<td>(2) If fuel leakage is not corrected, fuel economy will be reduced and there is a potential of fire.</td>
</tr>
<tr>
<td>(3) Check each part for looseness. Tighten if necessary.</td>
<td>(3) If the parts are loose, vibrations will occur, and may subject the generator to trouble.</td>
</tr>
<tr>
<td>(4) Check the quantity of oil inside the crankcase, fill oil as necessary.</td>
<td>(4) If the engine is run with an insufficient quantity of oil, the piston and other moving parts will be damaged.</td>
</tr>
<tr>
<td>(5) Check equipments of control panel. When found damages, replace them.</td>
<td>(5) Can’t obtain any output which is needed.</td>
</tr>
</tbody>
</table>

16-2 CHECKS and MAINTENANCE for EVERY 20 HOURS

<table>
<thead>
<tr>
<th>Check and maintenance items</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>(1) Drain the oil from the crankcase.</td>
<td>(1) Replace with new oil. The oil used after the initial period of operation is likely to be heavily contaminated with fine metal powder and other foreign substances from various engine parts.</td>
</tr>
</tbody>
</table>

16-3 CHECKS and MAINTENANCE for EVERY 50 HOURS (every 10 days)

<table>
<thead>
<tr>
<th>Check and maintenance items</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>(1) Clean the air cleaner at the prescribed interval.</td>
<td>(1) If the air cleaner is continually used in contaminated condition, it may lead to engine trouble.</td>
</tr>
<tr>
<td>(2) Check the spark plug for carbon contamination. If found dirty, clean it with gasoline, followed by sandpaper.</td>
<td>(2) Should the plug be left in contaminated condition, an engine output will decline or it may fail to start.</td>
</tr>
</tbody>
</table>
16-4 CHECKS and MAINTENANCE for EVERY 200 HOURS (monthly)

<table>
<thead>
<tr>
<th>Check and maintenance items</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>(1) Drain the oil from the crankcase and replace with new oil. (every 100 hours)</td>
<td>(1) The use of contaminated oil will subject parts to excessive wear.</td>
</tr>
<tr>
<td>(2) Clean the fuel strainer and the fuel tank interior.</td>
<td>(2) If the contaminated fuel strainer and fuel tank are used continually, engine performance will be lessened and may lead to engine trouble.</td>
</tr>
</tbody>
</table>

16-5 CHECKS and MAINTENANCE for EVERY 500 HOURS (semi-annually)

<table>
<thead>
<tr>
<th>Check and maintenance items</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>(1) Remove the cylinder head, and remove carbon deposits.</td>
<td></td>
</tr>
<tr>
<td>(2) Disassembly and cleaning of engine carburetor.</td>
<td></td>
</tr>
<tr>
<td>(3) Check the switch of engine and flexible shaft.</td>
<td></td>
</tr>
</tbody>
</table>

16-6 CHECKS and MAINTENANCE for EVERY 1000 HOURS (annually)

<table>
<thead>
<tr>
<th>Check and maintenance items</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>(1) Overhaul the engine for cleaning, adjustment and parts replacement.</td>
<td>(1) If the engine is used continually without an annual overhaul, it may lead to engine trouble.</td>
</tr>
<tr>
<td>(2) Replace the piston rings.</td>
<td>(2) If the engine is used continually without an annual overhaul, it may lead to engine trouble.</td>
</tr>
<tr>
<td>(3) Replace the fuel pipe.</td>
<td>(3) An old fuel pipe is likely to leak.</td>
</tr>
<tr>
<td>(4) Check all the relative parts of the generator.</td>
<td>(4) Can't obtain any output which is needed.</td>
</tr>
</tbody>
</table>

16-7 WHEN THE GENERATOR IS NOT USED for PROLONGED PERIODS:

1) Be sure to check the generator daily as instructed in 16-1 above and it is required that the generator receive the 20-hour check and maintenance detailed in 16-2.
2) Drain the fuel from the tank and from the float chamber of the carburetor.
3) To prevent the cylinder wall from rusting, remove the spark plug and lubricate the interior at the cylinder. Then, pull the recoil starter knob two or three times, and replace the spark plug.
4) Keep the piston stationary, at the position where the piston stroke feels the heaviest.
5) Clean the engine exterior, using an oil impregnated cloth, and then place a vinyl cover or other cloth over the generator in a dry place where it will not be subject to high humidity.
